

Fast, Permanent Marking on Many Surfaces

Laser marking is a permanent mark on the target surface – usually metal, ceramic, glass, paper, cardboard or wood. A fume extractor is required in some applications where burning the mark onto the surface releases gasses that need to be vented or removed. We carry a full line of laser marking systems, including the products below.

Matthews

The Matthews line of laser marking systems offers powerful marking solutions for many consumer goods and industrial applications.

Videojet

A well-rounded laser marking system, the Videojet offers several accessories including lenses and beam turning units, making it fit the bill for many applications.

BOFA Fume Extractors

Sometimes required with laser marking systems, fume extractors capture hazardous fumes and dust to keep your production environment clean and safe from harmful airborne toxins. BOFA has a complete line of extractors and filter, like the AD 350 pictured here.
